

TRADINGVIEW INDICATOR SETUP GUIDE

How approved HPT members request access, find invite-only scripts, add them to a chart, and fix the most common setup problems.

THE ONE RULE

Use the **exact TradingView account** you want approved. A display name, email address, Discord username, password, or verification code cannot replace your exact TradingView username.

The complete member path

- 1 Sign in to the correct TradingView account**
Open TradingView and confirm the username shown in your profile. Access is attached to that exact username, not to your device or HPT Discord role.
- 2 Submit one private access request**
In HPT Discord, open **PAID MEMBER HOME** and use **#request-indicator-access**. Submit only: exact TradingView username, membership platform, requested indicator or package, and Discord username.
- 3 Wait for HPT approval**
Opening an indicator link does not grant access. HPT verifies eligibility and adds your exact username in TradingView. Access is managed separately for each script.
- 4 Add the approved indicator to a chart**
Open a Superchart. Select **Indicators, Metrics & Strategies**, open **Invite-only scripts**, and choose the approved HPT indicator. You can also open its TradingView page and select **Use on chart** after approval.

HPT NEVER NEEDS YOUR PASSWORD, 2FA CODE, PAYMENT DETAILS, API KEY, OR LOGIN SCREENSHOT.

2 | ADD IT CORRECTLY

The Invite-only scripts tab appears only after TradingView has granted your account access to at least one invite-only publication.

01	Open a TradingView Superchart Use the web, desktop, or mobile app while signed into the approved account.
02	Open Indicators, Metrics & Strategies On desktop it is in the chart toolbar. On mobile, open the chart tools and choose Indicators.
03	Select Invite-only scripts If this tab is absent, check the account username and confirm that HPT approved access.
04	Choose the HPT indicator Selecting it adds the script to the active chart. Repeat for any other approved HPT tool.
05	Save the layout Save or rename the TradingView layout so your approved indicators remain on the intended workspace.

Change settings without breaking the chart

SETTINGS	Find the indicator name on the chart and select the gear icon. Inputs control calculations, Style controls colors and plots, and Visibility controls the timeframes where it appears.
REMOVE	Select the X beside the indicator name or use the Object Tree. Removing an indicator from one layout does not remove your TradingView access.
RE-ADD	If HPT publishes an update and the chart looks stale, remove the old chart instance and add the approved indicator again from Invite-only scripts.

WHERE THE CURRENT HPT LIST LIVES

Use **#private-indicators** for the approved indicator index and **#how-to-add-indicators** for this guide. Do not use old links from screenshots, forwarded messages, or unofficial accounts.

3 | FIX THE COMMON PROBLEMS

INVITE-ONLY SCRIPTS TAB IS MISSING

You are signed into the wrong TradingView account, HPT has not approved the username yet, or the account does not currently have access to any invite-only script.

USE ON CHART IS DISABLED

The page link is working, but your username is not approved for that publication. Submit or update the private HPT access request.

APPROVED TOOL DOES NOT APPEAR

Refresh TradingView, close and reopen the chart, and verify the profile username. Then search the exact publication title inside Invite-only scripts.

THE CHART LOOKS WRONG

Open the indicator settings and verify Inputs, Style, symbol, timeframe, and layout. Remove and re-add the indicator if a chart instance is stale.

ACCESS WORKED BEFORE BUT STOPPED

Membership or time-limited TradingView access may have expired, or HPT may have replaced the publication. Use the private access channel so staff can check the exact username and script.

TRADINGVIEW SHOWS A RUNTIME ERROR

Screenshot only the error and indicator name. Do not include login information, payment details, private account data, or credentials. Submit the error inside the private support ticket.
